FOREWORD

The Central Bureau of Statistics (CBS) has conducted Annual Agriculture Surveys (AAS) since the agricultural season 1996/1997, The Namibia Agricultural Census (NAC) that was conducted during the 1994/1995 agricultural season preceded the start of the Annual Agriculture Surveys (AAS).

This final report is the last in a series since the publication of the first AAS results for the 1996/1997 agricultural surveys. The report primarily concentrates on both the findings and analysis of the seven survey results. Due to certain unforeseen conditions coupled with some technical problems, the 2000/2001 Annual Agricultural Report could not be published on time. As a result, and for cost saving purposes, the results for all the seven Annual Agricultural Surveys since 1996/97 are consolidated in this report and as such marks the final report for the first round of Annual Agricultural Surveys. A full-scale Namibia National Census of Agricultural will follow this during the 2004/2005 agricultural seasons. Another reason for the delay in the timely release of the previous AAS reports was the pressing need for gender desegregations in the presentation of agricultural statistics; such an endeavor required more time.

Generally, this report presents the basic and major findings of the agricultural surveys and highlights the dominant features of communal agriculture in the six northern regions of Namibia, namely; Caprivi, Kavango, Ohangwena, Omusati, Oshana, and Oshikoto. Thus, the publication puts together a time series of agricultural statistics relating to the communal areas for the surveys conducted.

It is indeed a pleasure to present this publication of the first round of Annual Agricultural Surveys conducted since 1996/1997. The report provides an un-interrupted, comprehensive time-series of data over the years from 1996 to 2003. It is also the first report of its kind whereby agricultural statistical data has been disaggregated by gender. Efforts have been made to present the findings in as simple a form as possible with the hope that it will assist planners and decision makers in formulating, implementing and monitoring effective development plans for the agricultural and rural sectors of the Namibian economy.

The entire series of the Annual Agricultural Survey field operations have been entirely supported by the Namibian Government under capital budget arrangements. The Central Bureau of Statistics and the Department of Planning within the Ministry of Agriculture, Water and rural Development have closely consulted and cooperated in the execution and success of the survey operation over the years.

I would like to acknowledge and express my sincere appreciation to all those who have contributed to the success of this exercise. They include, in particular the subsistence farming community; the regional Governors and Councillors; the Central Bureau of Statistics and the Directorate of Planning within the Ministry of Agriculture, Water and Rural Development, whose support and cooperation have enabled the publication of these survey results.

.....
Hon. Immanuel Ngatjizeko (MP)
Director General: National Planning Commission
November, 2004

CHAPTER 1: BACKGROUND

1.1 INTRODUCTION

Agriculture is the second most important economic sector (besides mining) in the Namibian economy. Though its contribution to the overall economic activity is small (about 6 percent of GDP), the sector is the main source of livelihood for the majority of the Namibian population, mainly for the subsistence rural areas. It is estimated that more than 70 percent of the population in the country depend to a greater extent, on the agricultural sector. Prior to the independence of Namibia, most agricultural services and efforts were directed towards supporting commercial agriculture.

The largely ignored communal farming sector consists of, and supports about close to 100,000 households (about 770,000 persons). The major requirement at independence was to provide statistics to enable description and analysis of activities of the largely poor farm population in the sector. The Survey is meant to provide statistical information relating to agriculture nationally, regionally and by sector. The main aim, amongst others, was to enable analysis and evaluation of the sector performance, for the assessment of policy measures relating to the sector.

The Central Bureau of Statistics (CBS) in the National Planning Commission Secretariat (NPCS), in collaboration with the Directorate of Planning (DoP) in the Ministry of Agriculture, Water and Rural Development (MAWRD), conducts the Annual Agricultural Survey (AAS). As an institutional arrangement, the survey is undertaken by the CBS.

Since the first round of survey in 1996, seven Annual Agricultural Surveys have been conducted up to 2003. The surveys are conducted to gather agricultural information to provide a time series on areas planted/harvested, and also data on the production and yield of selected crops. This report presents a summary of the surveys' data providing a time series of survey results. All efforts have been made to disaggregate and present the data by gender.

1.2 SCOPE/COVERAGE

The survey relates to agriculture and the rural sector of the Namibian economy covering agricultural households on a sample basis. The survey covers the six regions that make up the Northern Communal regions of Namibia, namely; Caprivi, Kavango, Ohangwena, Omusati, Oshana, and Oshikoto.

Basic data on area planted, production and yield of pearl millet (mahangu), sorghum and maize, as well as a limited range of data on livestock, are collected during the survey for each agricultural unit (farming household) in the sample.

1.3 SAMPLE DESIGN

A two-stage sampling procedure is used to select holdings. At the first stage, a sample of Primary Sampling Units (PSU's) was selected from the Master Sample Frame (MSF) based on the 1991 Population and Housing Census. At the second stage, a sample of 12 agricultural holdings was selected from within each of the sampled PSU's.

On average, the survey was conducted on 118 Primary Sampling Units (PSU's), comprising about 1,400 agricultural holdings. The survey was designed to provide data at regional level. The sample is considered large enough to provide sufficiently reliable regional estimates.

Table 1 below shows the number of PSU's and of agricultural holdings included in the sample by region.

*Table 1: Number of PSU's and Agricultural Holdings by Region**

Region	1996 - 2003	
	PSU's	Holdings
Caprivi	19	216
Kavango	20	240
Ohangwena	20	240
Omusati	19	226
Oshana	22	264
Oshikoto	18	216
Total	118	1,402

*For the 1999/2000 Survey, Caprivi and Kavango Regions were not covered.

For purposes of comparison, the sample size has been kept more or less the same over time. In this way, estimation procedures are more or less standard, for consistency of results and accuracy. These sample sizes above allow derivation of sample estimates at the regional level with degrees of precision varying between 10 and 30 percent.

1.4 DATA COLLECTION

Personal face-to-face interview method was applied to collect the data from households. Thus, over a designated survey period, interviewers visited selected households to solicit for the required information, by asking the respondent(s) questions whose replies were recorded on a prescribed questionnaire.

1.5 TRAINING OF FIELD STAFF

Detailed instruction manuals for the survey are prepared to assist in the training. The manuals are useful for reference in the field and in the formulation of processing procedures. All staff concerned with the data collection, supervisors and enumerators is trained intensively for one week on interview techniques and survey procedures.

1.6 FIELD OPERATION/ENUMERATION

Field operations are under the overall control of the agricultural statistics sub-division unit of the CBS. For close control and supervision of the surveys, a team of four enumerators and one supervisor is formed. For mobility, each team was provided with a vehicle and other necessary survey equipment and material.

1.7 DATA PROCESSING

Data processing systems used were the IMPS programs, MS Access and MS Excel. Thus, the process was in three stages as follows:

- Data entry based on the IMPS programs;
- Data editing by “eye-ball” inspection and by use of the IMPS program;
- Tabulation involves the conversion of edited data files into MS Access.

In the process, queries are generated and query results sent to MS Excel for final tabulation and formatting. The final report was prepared using MS Word.

1.8 SURVEY RESULTS

Basic results of the survey are presented in Chapters 2 and 3 of this report. In particular, the results relate to the synopsis presented in Chapter 2 and Characteristics of agricultural holdings detailed in Chapter 3.

CHAPTER 2: MAIN RESULTS

2.1 INTRODUCTION

The zone covered in each of the annual surveys comprised of the regions that form the Northern Communal Area of the country, namely Caprivi, Kavango, Ohangwena, Omusati, Oshana and Oshikoto. This section is a summary of agricultural households characteristics and their activities. The survey exercise concentrated on the northern six regions of the country because these are where the major communal agronomic practices are taking place. This is because there are no significant agro-practices at subsistence level within the other regions of the country where notable crop production in the major three subsistence crops growing of pearl millet/mahangu, sorghum, and maize is practiced.

It should further be noted that the two regions Caprivi and Kavango were not surveyed during the 1999/2000 agricultural survey due to reasons of over-flooding and poor harvesting. Thus, figures for this agricultural season for the two regions in all the tables are noted as NA, meant to stand for Not Available.

In addition, it is the first time in the presentation of these time-series data, that the figures in the tables are summarily disaggregated by gender. The tabulations were run and analysed according to the recorded numbers of men and women heads of households. A head of household is defined here as a person who is a member of a household and generally runs the affairs of the household. Normally, the head is looked upon by other members of the household as the main decision-maker.

A general observation is that the results show a big variation and disparities of participation in agricultural practices between men and women-headed households in the communal agricultural sector. Looking at the figures and comparing the tables over time, it can be safely concluded that there is a slight trend of closing the gap of disparity, although variations within representative figures over time still remain.

2.2 AGRICULTURAL HOUSEHOLDS PLANTING

In the Annual Agricultural Surveys, an agricultural household is defined as an economic unit of agricultural production under single management, comprising all livestock kept and all arable land used, wholly or partly, for the purpose of agricultural production, without regard to title, legal form or size. The target population is defined according to the following criteria, concerning land and livestock, i.e. a households having planted any of the cereal crops; Pearl Millet (Mahangu), Sorghum, and Maize. To be included in the survey, an agricultural holding requires fulfilling the criteria.

Table 2: Estimated number of Households Planting by Region, Cropping Season And Sex of Head of Household.

Region	1996/1997		1997/1998		1998/1999		1999/2000		2000/2001		2001/2002		2002/2003	
	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men
Caprivi	3,737	7,874	3,786	7,552	5,510	5,290	NA	NA	6,601	5,090	7,053	5,782	6,948	5,608
Kavango	3,002	7,269	2,481	5,903	2,593	6,013	NA	NA	4,794	6,459	3,728	5,655	4,338	6,738
Ohangwena	11,235	17,552	9,857	17,027	11,653	14,292	9,461	16,495	9,453	16,618	12,597	13,570	10,643	16,573
Omusati	8,031	13,821	9,575	12,764	8,564	14,672	10,222	13,551	8,130	16,731	10,828	15,940	12,302	14,733
Oshana	5,192	9,358	5,722	10,568	6,085	10,441	7,869	8,613	7,248	8,955	7,750	8,763	8,213	8,385
Oshikoto	5,600	9,686	5,615	10,357	6,561	9,870	7,992	7,565	7,217	9,489	8,463	9,293	8,192	9,566
Total	36,797	65,560	37,037	64,171	40,967	60,578	35,544	46,224	43,443	63,342	50,419	59,003	50,636	61,603

The estimated figures show a similar trend of variation over the survey periods. Thus, comparing the results for the last two surveys, during the agricultural season 2001/2002, for all regions, an estimated 109,422 households reported having planted cereal crops compared to 106,786 who planted in the 2000/2001 seasons. This represents a marginal increase of 1.2 percent in the estimated number of households planting. It also shows that the men-headed households, which planted any crop, out-numbered the women-headed households by an average of 4 percent. However, the number of women-headed households planting increased from 43,000 in 2000/01 to 50,000 in 2001/02, representing a 5.4 percentage increase whereas the men-headed households decreased by the same percentage margin between the two years.

During both agricultural seasons, 2000/01 and 2001/02, the proportion of households planting was highest in Ohangwena and Omusati regions with an average of 27 percent for men-headed and 20 percent for women-headed households in Omusati and 25 percent men-headed and 24 percent for women-headed households in Ohangwena. The rest of the regions ranged between a low average of 15 percent men-headed households in 2000/01 for Caprivi and a high of 17 women-headed households planting in 2001/02 for Oshikoto.

On average, the total number of households planting varies between 37,000 and 51,000 women-headed households and 61,000 and 66,000 men-headed households. The number of men-headed households planting gradually decreased over the years as compared to the number of women-headed households increasing over the survey periods.

2.3 POPULATION PLANTING

Table 3: Estimated Total Population Living in Holdings by Region, Cropping Season, and Sex of Head of Household.

Region	1996/1997		1997/1998		1998/1999		1999/2000		2000/2001		2001/2002		2002/2003	
	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men
Caprivi	22,988	54,834	24,799	52,055	32,402	31,339	NA	NA	31,511	35,968	39,163	36,207	38,319	34,987
Kavango	23,765	60,570	17,394	46,038	16,748	46,213	NA	NA	34,808	51,150	23,469	42,800	33,622	53,996
Oshana	89,068	151,615	68,346	150,100	82,714	140,923	65,017	140,335	72,159	156,570	84,153	106,703	72,288	141,298
Omusati	64,834	119,615	78,225	116,371	67,117	138,852	74,606	112,136	63,500	138,113	78,918	111,966	79,184	104,872
Oshana	42,031	91,628	39,828	91,494	49,513	85,117	55,257	67,742	46,735	77,873	50,516	73,222	57,446	63,149
Oshikoto	45,375	85,883	45,690	82,175	45,378	83,052	53,899	62,924	53,662	74,249	56,132	66,998	51,249	73,120
Total	288,061	564,145	274,282	538,233	293,872	525,496	248,779	383,137	302,375	533,923	332,351	437,896	332,108	471,422

This table basically shows the same trend of development and progression as Table 2 above. The estimated total population in households that have planted some crop in 2000/01 was 836,298 households represented by 64 percent men- and 36 percent women-headed households as compared to an estimated total of 770,247 households in 2001/02 represented by 43 percent women- and 57 percent men-headed households.

The estimated proportions of the total population planting in the season 2000/01 were highest for Ohangwena with 29 and 24 percent for men- and women-headed households respectively, followed by Omusati with 26 and 21 percent for men- and women-headed households respectively. The lowest proportion of the estimated total population of households planting were recorded in Caprivi, Kavango, Oshikoto and Oshana, in that order ranging from a low of 7 percent in Caprivi for men-headed households to a high of 18 percent in Oshikoto for women-headed households in 2000/01.

2.4 ACTIVE POPULATION

The active population comprises of all persons providing labor to produce economic goods and services, on an agricultural holding. Everybody old enough to work and who has worked during the time of the survey will be counted in the economically active population. Thus, any person(s) who does some work on the holding is considered active. The produce may not be intended for the market. However, a person who never or seldom participates in agricultural activity of the household is classified as not active.

Table 4: Estimated active Population Planting by Region, Cropping Season, and Sex of Head of Household.

Region	1996/1997		1997/1998		1998/1999		1999/2000		2000/2001		2001/2002		2002/2003	
	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men
Caprivi	16,522	36,609	19,145	36,374	26,741	24,336	NA	NA	24,651	26,699	30,794	29,195	30,136	27,943
Kavango	15,859	38,825	9,933	29,851	10,962	32,596	NA	NA	25,797	40,297	18,706	31,948	22,586	36,078
Ohangwena	64,732	113,714	45,012	97,744	63,525	111,457	45,273	96,894	55,586	128,976	61,920	83,547	53,103	107,937
Omusati	47,206	87,541	55,422	80,964	49,403	101,834	51,848	81,293	54,088	118,210	63,830	92,987	64,052	86,810
Oshana	27,354	64,415	28,690	69,510	37,811	68,654	41,645	52,476	37,761	65,222	39,138	55,371	42,791	49,267
Oshikoto	31,723	59,061	30,290	59,878	33,063	62,529	39,975	47,838	43,922	60,952	55,859	45,501	41,162	58,101
Total	203,396	400,165	188,492	374,321	221,505	401,406	178,741	278,501	241,805	440,356	270,247	338,549	253,8301	366,136

The active population among households planting relates to the numbers that were available for agricultural labour. This is one of the most important variables in the measure of agricultural output produce because in subsistence farming practice, the area planted, i.e. size of the fields planted, is directly related and proportional to the number of people available to a household in the preparations; clearing, ploughing, fertilizing and seeding/planting of the fields.

For the agricultural season 2000/2001, the total active population among households was estimated to be 682,160 representing a 35:45 proportion of women-men-headed households. Of these, Ohangwena recorded the highest number of agriculturally active people among all the regions, showing a proportion of 29 percent active persons among men-headed households as compared to 23 percent of women-headed households. Omusati follows with 27 percent Men- and 22 percent women-headed households being active in agricultural economic activities on the holdings during the same season. Ohangwena and Omusati show a higher number of economically active persons in men-headed households than all the other regions for both the 2001 and 2002 agricultural seasons.

For the agricultural season 2001/2002, the total economically active population among households was estimated to be 608,796 representing a 44:39 proportion of women-men-headed households, indicating an increase of about 9 percent from the previous year. Of these, Ohangwena recorded the highest number of agriculturally active people among all the regions for the 2001/02 agricultural season, showing a proportion of 25 percent active persons within men-headed households whereas the percent of women-headed households remained the same as the previous year. Omusati follows with 27 percent men- and 24 percent women-headed households being active in agricultural activities on the holdings during the same season. There is obviously no significant variation in the numbers of economically active populations between the two agricultural seasons. In Caprivi and Oshikoto, the number of economically active persons headed by women, proportionally outnumber the men-headed households during both the 2000/01 and 2001/02 agricultural seasons.

2.5 OWNERSHIP OF IMPLEMENTS

Implements used and/or required for agricultural production are another important input variable contributing to the success or failure of the agricultural economic output because these facilitate and enhance the overall process of production. The major implements required for success for a better harvest output in communal subsistence farming are *inter-alia* a plough, draft power, and a milling machine.

Table 5: Ownership of Implements by Number of Households Planting, by Season and Sex of Head of Households.

Region	Season	Plough		Oxen		Milling Machine	
		Men	Women	Men	Women	Men	Women
Caprivi	1996/1997	3,689	976	3,071	1,262	0	0
	1997/1998	3,166	1,471	3,019	1,421	0	0
	1998/1999	2,626	2,264	2,836	2,669	0	0

Ownership of agricultural implements was measured in terms of milling machines, ploughs, and oxen, the most commonly used aids in production by communal farmers. Of these three implements, the most commonly owned and used are ploughs and oxen whereas very few households own milling machines. This may be because milling machines are rather expensive to acquire or not readily available. Almost all, or close to equal numbers of both men and women-headed households in the Caprivi do own a plough but do not own a milling machine.

It is notable that the number of men-headed households owning ploughs dramatically decreased between the 2000/01 to 2001/02 agricultural seasons whereas the number of women-headed households owning the same drastically increased between the two agricultural years. This also proves to be true for women-headed households in ownership of oxen within all the regions except for Caprivi. A higher number of men- than women- headed households recorded ownership of ploughs in all the regions during the 2001/02 survey. The highest numbers of ownership of ploughs standing at 12,698, was recorded for men-headed households in the Omusati region during the 2001/02 agricultural season. However, more men-headed households did record ownership of oxen than women-headed households during the same year in all the regions.

This table shows an extreme variation between the numbers of households owning agricultural implements from one year to another for both men- and women-headed households. For example, in Oshikoto and the Kavango, though some ownership of milling machines was recorded in 2000/01, non-was recorded for the 2001/02 agricultural season including Caprivi. Such disparities may be attributed to the variations in the randomness of the sampling procedure whereas the sample in one year may include populations owning implements or the variables under study and exclude the same from one survey/year to another.

2.6 INPUT USE

In order to produce agricultural output, farmers use inputs. The inputs include seeds, fertilizers, and compost manure.

2.6.1 SEED USE

The seeds used are analyzed according to area planted to cereal crops. It should be noted that the area planted to any variety of seed under study is considered to be proportional to the quantity of seeds used. This would mean that the bigger the area planted to any seed variety, the bigger the amount of seed used. The table below shows the use of various types of seeds of planted cereal crops, focusing on Mahangu, Sorghum and Maize. The seeds used are traditional, improved or a mixture of the two. Generally, in the communal areas, traditional seed is most common, with sorghum and maize the leading ones. Improved seed is used mostly for mahangu. Mixed seed is used mostly in Ohangwena, Oshana and Oshikoto and Omusati as compared to Caprivi and Kavango.

Table 6: Total Area Planted (Ha) to Mahangu Seed by Region, Season, and Sex of Head of Household.

Region	Season	Traditional		Improved		Improved+Traditional	
		Women	Men	Women	Men	Women	Men

	2001/2002	9,887	13,709	2,621	2,176	9,727	14,897
	2002/2003	12,972	23,184	1,404	1,011	5,997	11,979

Table 6 follows a general trend indicating that for all three variety types of mahangu seeds, a higher number of men- than women-headed households are recorded having planted any variety of mahangu seed over the survey periods. This table also shows that in general, the majority of households using mahangu seed prefer the traditional type of seed first, followed by the combined variety of improved and traditional and lastly the improved type of seed in that order, except for Oshikoto and Oshana that shows a preference in the use of a mixture of improved and traditional seed.

The total area planted to mahangu seed in Ohangwena was highest at about 74,000 hectares in 2001/02 as compared to 65,000 hectares in 2000/01 in the Omusati region followed by Ohangwena with a high of 60,000 in 2001/02 and 58,000 in 2000/01 and then about 53,000 hectares in Oshikoto for both years. Oshana then followed with 42,000 hectares planted in 2000/01 compared to 40,000 hectares in 2001/02. The lowest figures for areas planted to mahangu seed were recorded for Kavango 19,000 hectares in 2000/01 and 12,000 hectares in 2001/02 as compared to area planted in the Caprivi with a high of 13,000 hectares in 2000/01 and a low of 7,000 hectares planted to mahangu seed in 2001/02.

It can also be noted that, throughout all the years, 2002/03 recorded the highest number of total area planted to mahangu seed comparatively for all the regions. Once again, the men-headed households slightly outnumbered the women-headed households in the use of mahangu seed, especially mixed type of mahangu seed.

Table 9 shows the number of men- and women-headed households for each region that have ploughed their fields and it also indicates the number of households that used some manure/compost and some chemical to fertilize their fields. A general trend once again indicates that for all three variables under study, a higher number of men-headed households recorded having ploughed, used compost and fertilizer than women-headed households over all the survey periods.

The data also show that in general, the majority of households did plough their fields before planting. However, it is notably more common for a higher percentage of households to use compost or manure than chemical fertilizers for agro-input purposes. Of these, a higher proportion of men- than women-headed households recorded using chemical fertilizers within all the regions for all the survey years.

2.8 AREA AND NUMBER OF FIELDS PLANTED

Oshikoto	5,815	9,686	5,615	10,497	6,620	9,943	7,992	7,659	7,217	9,489	7,217	9,489	13,603	16,706
Total	38,299	69,707	37,657	66,096	41,798	62,104	35,787	46,805	43,681	64,178	52,759	64,249	85,366	104,280

During the agricultural season 2000/01, the total area planted to cereals crops was 261,161 on 107,859 fields within all the regions. Of these, the area planted by women-headed households was 167,890 hectares (64%) on 43,681 fields (41%) compared to 93,271 hectares (36%) on 64,178 fields (60%) by men-headed households. On average, comparing all the regions, the area planted by women-headed households were much bigger than the area planted by men-headed households except in the Caprivi region. But, the number of fields planted by men-headed households were much bigger than the area planted by men-headed households except in the Caprivi region.

During the 2001/02 agricultural season, the total area planted to cereals crops was 280,544 on 117,008 fields in all the regions. Of these, the area planted by women-headed households was 167,839 hectares (58%) on 52,759 fields (45%) compared to 122,705 hectares (42%) on 64,249 fields (55%) by men-headed households. The figures indicate that there was, on average a significant increase in the area planted by women-headed households from 2000/01 to 2001/02. By average, the number of fields planted by men-headed households in all the regions were bigger in size than area planted by men-headed households except in the Caprivi and Kavango regions.

Production figures were relatively higher during the 2002/03 cropping season compared to previous year for both male- and female-headed households. The highest production figures were recorded in Omusati and Ohangwena for both 2001/02 and 2002/03.

2.9.2 Livestock

Livestock covered in the surveys included cattle, goats, sheep, pigs, donkeys/mules, and horses. Poultry are mainly chickens. The Tables below show the distribution of livestock owned by type and region in the agricultural season's 1996/97 through 2002/03. Ownership of livestock is distributed over all regions covered by the survey.

Ownership of livestock (as used in the AAS) is to be distinguished from raising livestock. For the former, farmers that keep livestock are assumed to be owners. Generally, however, for purposes of agricultural statistics, "raising" livestock is the preferred concept. Raising for the purpose of the surveys, means the management of the livestock, regardless of who owns them. In this sense, raising of livestock relates to the management by the agricultural holding and not to ownership. In the AAS, the concept of ownership is used for the livestock numbers on holdings.

Table 14: Summary of Total Cattle owned in Namibia by type.

Season	Bulls	Female Calves	Cows	Male Calves	Heifers	Oxen	Tollies	Barren Cows	Total Cattle	
									Male	Female
1996/97	38,109	87,232	260,844	80,216	76,460	94,316	60,923	9,147	273,562	433,684
1997/98	31,293	76,460	229,871	67,714	98,732	72,908	54,759	32,109	226,672	437,171
1998/99	52,734	133,515	313,959	106,949	102,042	118,208	83,447	11,455	361,335	560,971
1999/00	30,371	73,328	184,218	61,071	67,929	79,702	47,556	4,913	218,698	330,390
2000/01	39,638	113,916	336,986	89,219	99,313	108,852	84,306	10,083	322,015	560,300
2001/02	34,180	95,148	281,490	75,545	94,061	114,409	78,975	6,393	303,110	477,091
2002/03	40,302	92,932	266,074	76,156	91,940	113,295	75,655	5,789	305,406	456,140

In Namibia, there were 707,246 cattle recorded owned during the Agricultural Season 1996/97, compared to 663,843 in 1997/98 and 922,306 in 1998/99. In the Season 1999/00 (excluding Caprivi and Kavango), there were, 549, 088 cattle in the Northern Communal Areas of Namibia, out of which 58 percent were female (calves, cows and heifers).

Within the time series of data, over the period 1996 through 2003, an all high total number of 922,306 cattle owned was recorded for the 1998/99 season and a low of 549,088 in 1999/00 survey, this was due mainly to the exclusion of Caprivi and Kavango from the survey during that year.

Cows are recorded to be substantially more in all the regions followed by female calves and oxen. However, in the 2000/01 season, a bigger number of cows (23%) and female calves (18%) were recorded in the Caprivi than any other region. Also, during 2001/02, a bigger number of cows and female calves (at 23% for both) were recorded.

Between 2001/02 and 2002/03, the numbers of all types of livestock remained fairly constant except for the number of bulls which show a marginal increase of about 8 percent.

Table 16: Summary of other Livestock owned by Type Season..

Season	Goats		Sheep		Pigs		Donkeys		Horses		Poultry	
	Men	Women	Men	Women	Men	Women	Men	Women	Men	Women	Men	Women
1996/1997	711,143	309,168	17,983	21,168	38,006	19,680	69,423	14,354	631	1,408	548,217	234,868
1997/1998	759,576	348,903	18,108	6,941	46,142	24,487	95,495	17,636	2,347	0	625,693	321,741
1998/1999	824,748	390,669	29,980	7,548	56,920	33,034	86,309	20,833	2,421	720	625,845	347,242
1999/2000	671,960	313,205	24,881	4,287	47,573	25,709	66,167	24,455	2,281	662	461,988	266,386
2000/2001	644,583	262,747	16,675	4,552	49,011	21,330	85,376	22,271	3,593	318	629,213	298,895
2001/2002	612,694	271,923	19,338	5,144	40,908	29,287	79,481	45,969	2,000	1,890	622,316	567,413
2002/2003	747,725	352,564	24,953	4,294	48,905	30,463	90,458	29,616	1,866	532	633,082	534,672

For the two agricultural seasons 2000/01 and 2001/02, the table shows a general increase in the number of households owning other types of livestock except for the number of pigs owned which shows a 50 percent average decline over the same two periods for both men- and women headed households. It is also clear that goats, then poultry followed by pigs (in that order), are most commonly owned by agricultural households all regions.

During the 2000/01 agricultural season, a higher number of men-headed households (71%) against women-headed households (29%) have recorded owning goats in all the regions. This compares to 69% men-headed households and 31% women-headed households in the 2002 agricultural season, representing a variable proportion of 3% between men- and woman-headed households between the two survey years.

For both the 2000/01 and 2001/02 agricultural seasons, men-headed households were higher than the women-headed households in ownership of pigs. Very few sheep are owned in the Caprivi and the Kavango as compared to the other regions. Horses are not commonly owned in the northern communal agricultural sector.

2.10 SOURCES OF INCOME

Agriculture is an important source of income among agricultural households in Namibia. Other major sources of income identified during the agricultural surveys are pension, remittances, and wages from work. Table 17 below shows the number of households by common source of income, region. Agricultural year desegregated by sex of heads of household.

Table 17: Number of Households by Source of Income, Region, Season and Sex of Head of Household

Region	Season	Agriculture		Pension		Remittances		Wages

2001/2002	19,227	15,566	21,075	21,729	4,811	5,906	13,749	7,119
2002/2003	18,834	16,041	21,354	23,101	4,043	6,666	17,361	5,181

According to the survey, agriculture and pension are two major sources of income among agricultural households in northern Namibia. On average, about 30 percent of agricultural households depend on agriculture itself as a source of income while 38 percent depend on pensions. For the 1999/00-survey year, the two averages are 36 percent and 33 percent respectively.

Based on the 2000/01 surveys, for all the regions, out of a total number of 32,677 households, about 52% men-headed households and 48% women-headed households recorded being depended on agriculture as compared to 53% men-headed households 47% women-headed households depending on pension pay-outs as the main source of income.

Based on the 2001/02 survey, for all the regions, out of a total number of 34,793 households, about 55% men-headed households compared to 45 women-headed households recorded being depended on agriculture as compared to about 50% fore both men- and women-headed households depending on pension pay-outs as the main source of income.

Based on the 2002/03 surveys, for all the regions, out of a total number of 34,875 households, about 54% men-headed households and 46% women-headed households recorded being depended on agriculture as compared to 48% men-headed households 52% women-headed households depending on pension pay-outs as the main source of income.

It should also be noted that, across the survey years, a high significant number of men-headed households (over 75%) recorded being depended on wages as a major source of income. However, the summary table shows an increase (about 48%) in the number of women-headed households that depend on wages between the 2000/01 and 2001/02 agricultural seasons. Thus, there seem to be a gradual increase over the time series in the number of women-headed households that record being dependent on wages as a main source of income within the surveyed regions over the survey period.

CHAPTER 3: CHARACTERISTICS OF HOLDINGS

Various characteristics of the holdings, including the number of persons; number of family workers; area planted to crops, are recorded during the Surveys. Among the characteristics, area planted is important. The area is used to classify the households by size category (according to area planted). Based on the classification of farming households by the size category of area planted to cereal crops there are identified three broad groups of holdings.

Group Category I - Holdings with less than one-hectare land of area planted.

Group Category II - Holdings with between one and four hectares of land area planted.

Group Category III - Holdings with over four hectares of land area planted.

Table 19: Distribution of Holdings by Size Category (area planted,) and Sex of Head of Household per Region.

During the 1998/99 agricultural season, there were 16,313 agricultural holdings recorded in category Group I. This group category planted a total of 9,711 hectares, representing three percent of the total land area planted. In category Group II, there were 62,536 holdings that planted cereals, representing about 62 percent of the agricultural holdings. The group cultivated 150,116 hectares of land, representing 52 percent of the total area planted. There were 22,622 holdings within Group III. This is 22 percent of the total land holdings. The group category cultivated 129,383 hectares or 45 percent on the total area.

APPENDIX A

A. CONCEPTS AND DEFINITIONS

Introduction

Definitions relating to the survey are important for the smooth execution of field procedures. They are important for comparison of the survey with others. Concepts and definitions used are based on internationally agreed standards.

1.2 Qualified Respondent:

As used in the survey, this is an adult member of the household who is knowledgeable about crop, land, livestock and poultry on the holding.

1.3 Communal Agriculture:

This covers agricultural activities (crop cultivation, livestock raising, and poultry rearing) on farms operated by family units on communal lands. Communal land is land that belongs to the community and which the community has user rights but no title.

1.4 Holder:

A holder is a person who exercises daily management control of an agricultural holding and its operation. The holder normally takes the current decisions regarding productive resource use such as: land, buildings, machinery, equipment, financial resources and participation in agricultural activity.

1.5 Holding:

A holding is an operational unit that consists of arable land (cultivated or fallow) and/or livestock. A holding is managed by a holder, who may or may necessarily be the owner of the land and livestock.

1.6 Household:

A household comprises persons who live together and share meals. The members of a household may be related or unrelated, but happen to live together in one or part of a housing or dwelling unit, sharing common catering arrangements. A person living alone may comprise a household.

1.7 Head of Household:

A head of household is a person who is a member of a household and generally runs the affairs of the household. The head of the household is looked upon by other members of a household as the main decision-maker of their every day affairs.

18 Agricultural Holding:

An agricultural holding is an economic unit of agricultural production under single management, comprising all livestock kept and all arable land used, wholly or partly, for the purpose of agricultural production, without regard to title, legal form or size. The holding is the analytical unit used in agricultural statistics defining an establishment used for agricultural (crops and/or livestock) production.

1.9 Sampling Unit:

This is the unit of selection, which may be Primary or Secondary in the AAS, PSU's are selected from a frame in the communal rural areas and communal small urban areas. PSU's, refer to agricultural holdings, the units of reporting.

1.10 Locality:

A locality is any place with one or more dwellings, either in a compact settlement or scattered houses. A locality may be a small or large village and small urban settlements.

1.11 Field/parcel:

A field is a piece of arable land owned and/or operated as one unit by a holder. A field may be planted with only one crop (pure stand) or with mixture of crops. An individual holding may consist of one or more such fields. A parcel is an undivided block of land in the holding, which is entirely surrounded, by land and/or water that does not belong to the same holding. A parcel may contain one or several fields growing one or different crops, it may have been left idle or fallow, or it may be under pasture.

1.12 Target Population:

The target population is one intended for coverage in a survey or census. In the AAS, the target population is defined according to a criterion, concerning land and/or livestock. This is to say at least one of the crops, mahangu, sorghum or maize have been planted or cultivated or some livestock (cattle, pigs, sheep or goats) raised by at least one member.
